KISS Rebreathers Loop Hose Update

Interested in upgrading your KISS system with new self-retracting loop hoses?

KISS is extremely proud to announce our new self-retracting loop hoses. This new improvement delivers an outstanding 13-20 inches of flex, offering users an extended range of motion. With the same durability that KISS divers have come to expect, these hoses are softer to the touch and nearly identical in appearance.

This transition was adopted in response to an increased demand for mobility in the most extreme of situations. We recognize that many KISS users are pushing exploration limits and saw the opportunity to extend the range of motion by providing increased hose flexibility. Another benefit of these hoses is that when not stretched they retract to be much more compact and out of the way.

Now shipping and available for purchase! Please email info@kissrebreathers.com for pricing information. For users who already have the last year's style of longer retractable hoses that would prefer a shorter hose – send us your old loop hoses and we will ship you the latest in retractable loop hose technology.

ABOUT KISS REBREATHERS

KISS Rebreathers is located in Fort Smith, Arkansas. They have been building and designing rebreathers since 1995, with the first units being sold in 1999.

The company philosophy of keeping it simple is applied to all products designed and built by KISS Rebreathers. The most reliable machines are those that are straightforward, easy to use, and easy to repair, regardless of what function they are meant to perform. When designing a machine that is meant to go underwater and that will be used as life support equipment, KISS Rebreathers feels that it is especially important to follow the keep it simple philosophy.
